

dataloader/__init__.py (Q&A)

Q: What is the purpose of dataloader/__init__.py? **A:** It makes the dataloader package easier to import by re-exporting the main loader class `KUAIRECDataloader` at the package level, so other scripts can do `from dataloader import KUAIRECDataloader`.

Q: What symbols does it expose? **A:** It imports `KUAIRECDataloader` from `dataloader/kuaiREC.py` and exposes it as `dataloader.KUAIRECDataloader`.

Q: What is an example of how other files use it? **A:** Run scripts (e.g. `run_egmn.py`) rely on this re-export to keep their imports short:

```
from dataloader import KUAIRECDataloader
```

Q: Full source code? **A:**

```
from __future__ import absolute_import
from dataloader.kuaiREC import KUAIRECDataloader
```
