

model/__init__.py (Q&A)

Q: What is the purpose of model/__init__.py? **A:** It turns the model/ folder into an importable Python package and provides a single import surface that re-exports the main model classes used by the training scripts.

Q: Which models are re-exported? **A:** It re-exports WideAndDeep, Cread, D2Q, TPM, and EGMN so scripts can write `from model import EGMN` instead of importing individual modules.

Q: Why does this pattern matter for the repo? **A:** The run scripts under the repo root depend on stable, short imports; re-exporting classes here decouples script imports from the file layout (e.g. renaming model/egmn.py would only require updating this file and not every run script).

Q: Full source code? **A:**

```
from __future__ import absolute_import
from model.wd import WideAndDeep
from model.cread import Cread
from model.d2q import D2Q
from model.tpm import TPM
from model.egmn import EGMN
```
